REST API Testing Using Postman

Test Case Report | Practice API: JSONPlaceholder

Purpose

This report documents beginner API test scenarios. Verify execution details in the saved Postman collection before sharing the report with recruiters.

Test Cases

ID	Method	Scenario	Endpoint	Expected Result	Actual / Notes
TC001	GET	Retrieve an existing post	/posts/1	200 OK; response contains post data	Record actual status and inspect JSON
TC002	GET	Validate post ID and title	/posts/1	ID equals 1; title is a non-empty string	Record whether assertions pass
TC003	GET	Request a nonexistent post	/posts/9999	404 Not Found is a conventional expected result	404 with empty JSON object {}
TC004	POST	Create a simulated post	/posts	201 Created; title matches; response includes ID	Three assertions passed; status 201
TC005	PUT	Update a simulated post	/posts/1	200 OK; title updated in response; ID equals 1	Three assertions passed
TC006	DELETE	Delete a simulated post	/posts/1	Successful response, typically 200 OK with {}	Execution reported; verify exact status/tests
TC007	GET	Check response time	/posts/1	Below chosen threshold, e.g. 5000 ms	Threshold adjusted after initial failure
TC008	GET	Check response body is not empty	/posts/1	Response body contains content	Record pass/fail from Postman

Bug Report Fields

Bug ID • Title • Environment • Endpoint/Method • Preconditions • Steps to Reproduce • Expected Result • Actual Result • Severity/Priority • Evidence • Status

Important: JSONPlaceholder simulates POST, PUT, and DELETE operations; these do not permanently change stored data. A test failure should be checked against requirements before it is classified as a defect.
